Problema Modelo - Difusão

Seja o domínio espacial $\Omega \subset \mathbb{R}^2$ com contorno $\partial\Omega$, dada as funções $f(x, y) : \Omega \rightarrow \mathbb{R}$, $\bar{u}(x, y) : \partial\Omega \rightarrow \mathbb{R}$ e $g(x, y)$, encontrar $u(x, y) : \Omega \rightarrow \mathbb{R}$, tal que:

$$-\Delta u(x, y) = - \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) = f(x, y) \quad \text{em } \Omega$$

suplementado por condições de contorno do tipo Dirichlet

$$u(x, y) = \bar{u}(x, y) \quad \text{sobre } \partial\Omega_D$$

ou Neumann

$$\nabla u(x, y) \cdot \mathbf{n} = g(x, y) \quad \text{sobre } \partial\Omega_N$$

onde \mathbf{n} é o vetor unitário normal com orientação exterior a $\partial\Omega_N$.

Discretização

Seja $u(x, y)$ e o domínio $\Omega = [a_x, b_x] \times [a_y, b_y]$ onde $x \in [a_x, b_x]$ e $y \in [a_y, b_y]$. Neste domínio definimos discretizações uniformes nas direções x e y , como segue

- ▶ $x_i = x_0 + i\Delta x, \quad i = 0, 1, \dots, I, \text{ com } \Delta x = \frac{b_x - a_x}{I - 1}$
- ▶ $y_j = y_0 + j\Delta y, \quad j = 0, 1, \dots, J, \text{ com } \Delta y = \frac{b_y - a_y}{J - 1}$

Neste contexto, definimos a seguinte discretização por diferença central para as derivadas de segunda ordem nas direções x e y :

$$\Delta u = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \approx \frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{\Delta x^2} + \frac{u_{i,j-1} - 2u_{i,j} + u_{i,j+1}}{\Delta y^2}$$

Discretização

Escolhendo $\Delta x = \Delta y = h$, temos que

$$\Delta u \approx \frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{h^2} + \frac{u_{i,j-1} - 2u_{i,j} + u_{i,j+1}}{h^2}$$

Logo podemos enunciar o seguinte problema discreto para difusão em 2 dimensões:

Encontrar $u_{i,j}$, com $i = 1, 2, \dots, I - 1$ e $j = 1, 2, \dots, J - 1$, satisfazendo:

$$-\left(\frac{u_{i-1,j} + u_{i,j-1} - 4u_{i,j} + u_{i+1,j} + u_{i,j+1}}{h^2}\right) = f(x_i, y_j)$$

com condição de contorno

$$u_{0,j} = u_{i,0} = u_{I,j} = u_{i,J} = \bar{u}$$

Metodologia de Resolução

Supondo 4×4 elementos, ou seja, $I = J = 5$, temos:

$$\mathbf{i} = 1 \text{ e } \mathbf{j} = 1$$

$$-\left(\frac{u_{i-1,j} + u_{i,j-1} - 4u_{i,j} + u_{i+1,j} + u_{i,j+1}}{h^2}\right) = f_{i,j}$$

logo

$$-\left(\frac{u_{0,1} + u_{1,0} - 4u_{1,1} + u_{2,1} + u_{1,2}}{h^2}\right) = f_{1,1}$$

ou ainda

$$-\left(\frac{-4u_{1,1} + u_{2,1} + u_{1,2}}{h^2}\right) = f(x_1, y_1) + \frac{u_{0,1} + u_{1,0}}{h^2}$$

$$-\frac{1}{h^2} \begin{bmatrix} -4 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ \times & \times & \times & \times & \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times & \times & \times & \times & \times \end{bmatrix} \begin{bmatrix} u_{1,1} \\ u_{2,1} \\ u_{3,1} \\ u_{1,2} \\ u_{2,2} \\ u_{3,2} \\ u_{1,3} \\ u_{2,3} \\ u_{3,3} \end{bmatrix} = \begin{bmatrix} f_{1,1} \\ f_{2,1} \\ f_{3,1} \\ f_{1,2} \\ f_{2,2} \\ f_{2,3} \\ f_{1,3} \\ f_{2,3} \\ f_{3,3} \end{bmatrix} + \frac{1}{h^2} \begin{bmatrix} u_{0,1} + u_{1,0} \\ \times \\ \times \\ \times \\ \times \\ \times \\ \times \\ \times \\ \times \end{bmatrix}$$

$$i = 2 \text{ e } j = 1$$

$$- \left(\frac{u_{i-1,j} + u_{i,j-1} - 4u_{i,j} + u_{i+1,j} + u_{i,j+1}}{h^2} \right) = f_{i,j}$$

$$-\frac{1}{h^2} \begin{bmatrix} -4 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & -4 & 1 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & -4 & 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 0 & -4 & 1 & 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & -4 & 1 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 & -4 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 & 0 & -4 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 1 & -4 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & -4 \end{bmatrix} \begin{bmatrix} u_{1,1} \\ u_{2,1} \\ u_{3,1} \\ u_{1,2} \\ u_{2,2} \\ u_{3,2} \\ u_{1,3} \\ u_{2,3} \\ u_{3,3} \end{bmatrix} = \begin{bmatrix} f_{1,1} \\ f_{2,1} \\ f_{3,1} \\ f_{1,2} \\ f_{2,2} \\ f_{2,3} \\ f_{1,3} \\ f_{2,3} \\ f_{3,3} \end{bmatrix} + \frac{1}{h^2} \begin{bmatrix} u_{0,1} + u_{1,0} \\ u_{2,0} \\ u_{2,0} + u_{4,1} \\ u_{0,2} \\ 0 \\ u_{4,2} \\ u_{0,3} + u_{1,4} \\ u_{2,4} \\ u_{4,3} + u_{3,4} \end{bmatrix}$$

Caso Geral

Dado um problema com $K \times K$ elementos, temos que a matriz gerada é da ordem de $(K - 1)^2$, ou seja, é uma matriz quadrada $(K - 1)^2 \times (K - 1)^2$, que pode ser generalizada como segue

$$\frac{1}{h^2} \begin{bmatrix} T & I & & & & \\ I & T & I & & & \\ & I & T & I & & \\ & & \ddots & \ddots & \ddots & \\ & & & I & T & I \\ & & & & I & T \end{bmatrix}, \quad T = \begin{bmatrix} -4 & 1 & & & & \\ 1 & -4 & 1 & & & \\ & 1 & -4 & 1 & & \\ & & \ddots & \ddots & \ddots & \\ & & & 1 & -4 & 1 \\ & & & & 1 & -4 \end{bmatrix}$$

onde I é a matriz identidade.

Para resolver pode-se empregar a decomposição LU que necessita de aproximadamente $\frac{2}{3}k^3$ operações, onde k é a dimensão da matriz.

Exemplo: Dada uma malha de 64×64 elementos, a matriz gerada é da ordem de $k = (K - 1)^2 = (64 - 1)^2 = 3969$. Assim, aplicando a decomposição LU, necessitamos de

$$\frac{2}{3}k^3 = \frac{2}{3}3969^3 = 41.682.334.806 \text{ operações.}$$

Encontrar $u(x, y)$ satisfazendo a seguinte equação:

$$\begin{aligned} -\Delta u(x, y) &= 2\pi^2 \sin(\pi x) \sin(\pi y) && \text{em } \Omega \\ u(x, y) &= \bar{u}, && \text{sobre } \partial\Omega \end{aligned}$$

onde \bar{u} é definido pela solução exata

$$u(x, y) = \sin(\pi x) \sin(\pi y).$$

Estudo de Convergência

Para este estudo foram adotadas malhas de 4×4 , 8×8 , 16×16 , 32×32 , 64×64 elementos.

Problema Modelo - Difusão-Convecção

Seja o domínio espacial $\Omega \subset \mathbb{R}^2$ com contorno $\partial\Omega$, dado $\varepsilon > 0$ e as funções $f(x, y) : \Omega \rightarrow \mathbb{R}$ e $\bar{u}(x, y) : \partial\Omega \rightarrow \mathbb{R}$ e o vetor $\mathbf{b} = (b_1, b_2)$, encontrar $u(x, y) : \Omega \rightarrow \mathbb{R}$, tal que:

$$-\varepsilon \Delta u(x, y) + \mathbf{b} \cdot \nabla u(x, y) = f(x, y) \quad \text{em } \Omega$$

ou ainda

$$-\varepsilon \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) + b_1 \frac{\partial u}{\partial x} + b_2 \frac{\partial u}{\partial y} = f(x, y)$$

suplementado por condições de contorno do tipo Dirichlet

$$u(x, y) = \bar{u}(x, y) \quad \text{sobre } \partial\Omega$$

Discretização Upwind

Adotando discretização central para a difusão

$$\Delta u = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \approx \frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{\Delta x^2} + \frac{u_{i,j-1} - 2u_{i,j} + u_{i,j+1}}{\Delta y^2}$$

e

$$\mathbf{b} \cdot \nabla u = b_1 \frac{\partial u}{\partial x} + b_2 \frac{\partial u}{\partial y} \approx \begin{cases} b_1 \frac{u_{i,j} - u_{i-1,j}}{\Delta x} + b_2 \frac{u_{i,j} - u_{i,j-1}}{\Delta y}, & b_1, b_2 > 0 \\ b_1 \frac{u_{i+1,j} - u_{i,j}}{\Delta x} + b_2 \frac{u_{i,j+1} - u_{i,j}}{\Delta y}, & b_1, b_2 < 0 \end{cases}$$

para o termo convectivo.

Discretização Upwind

Adotando $\Delta x = \Delta y = h$ e supondo $b_1, b_2 > 0$, temos:

$$\frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{h^2} + \frac{u_{i,j-1} - 2u_{i,j} + u_{i,j+1}}{h^2} + b_1 \frac{u_{i,j} - u_{i-1,j}}{h} + b_2 \frac{u_{i,j} - u_{i,j-1}}{h} = f(x_i, y_j)$$

Logo uma discretização para o problema modelo é dada por:

Encontrar $u_{i,j}$, com $i = 1, 2, \dots, I - 1$ e $j = 1, 2, \dots, J - 1$, satisfazendo:

$$-\varepsilon \left(\frac{u_{i-1,j} + u_{i,j-1} - 4u_{i,j} + u_{i+1,j} + u_{i,j+1}}{h^2} \right) + b_1 \frac{u_{i,j} - u_{i-1,j}}{h} + b_2 \frac{u_{i,j} - u_{i,j-1}}{h} = f(x_i, y_j)$$

Agrupando os termos, podemos reescrever como:

$$-\frac{1}{h^2} \left[(\varepsilon + b_1 h) u_{i-1,j} + (\varepsilon + b_2 h) u_{i,j-1} - (4\varepsilon + b_1 h + b_2 h) u_{i,j} + \varepsilon u_{i+1,j} + \varepsilon u_{i,j+1} \right] = f(x_i, y_j)$$

Discretização Esquema Central

Adotando discretização central para a difusão

$$\Delta u = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \approx \frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{\Delta x^2} + \frac{u_{i,j-1} - 2u_{i,j} + u_{i,j+1}}{\Delta y^2}$$

e central para a convecção

$$\mathbf{b} \cdot \nabla u = b_1 \frac{\partial u}{\partial x} + b_2 \frac{\partial u}{\partial y} \approx b_1 \frac{u_{i+1,j} - u_{i-1,j}}{2\Delta x} + b_2 \frac{u_{i,j+1} - u_{i,j-1}}{2\Delta y}$$

geramos a seguinte aproximação de segunda ordem:

Encontrar $u_{i,j}$, com $i = 1, 2, \dots, I - 1$ e $j = 1, 2, \dots, J - 1$, satisfazendo:

$$-\varepsilon \left(\frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{\Delta x^2} + \frac{u_{i,j-1} - 2u_{i,j} + u_{i,j+1}}{\Delta y^2} \right) + b_1 \frac{u_{i+1,j} - u_{i-1,j}}{2\Delta x} + b_2 \frac{u_{i,j+1} - u_{i,j-1}}{2\Delta y} = f(x_i, y_j)$$

Discretização Esquema Central

Adotando $\Delta x = \Delta y = h$, obtemos:

$$-\varepsilon \left(\frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{h^2} + \frac{u_{i,j-1} - 2u_{i,j} + u_{i,j+1}}{h^2} \right) \\ + b_1 \frac{u_{i+1,j} - u_{i-1,j}}{2h} + b_2 \frac{u_{i,j+1} - u_{i,j-1}}{2h} = f(x_i, y_j)$$

Logo, temos que

$$-\varepsilon \left(\frac{u_{i-1,j} + u_{i,j-1} - 4u_{i,j} + u_{i+1,j} + u_{i,j+1}}{h^2} \right) \\ + b_1 \frac{u_{i+1,j} - u_{i-1,j}}{2h} + b_2 \frac{u_{i,j+1} - u_{i,j-1}}{2h} = f(x_i, y_j)$$

Agrupando os termos, podemos reescrever como:

$$-\frac{1}{h^2} \left[(\varepsilon + b_1 h/2) u_{i-1,j} + (\varepsilon + b_2 h/2) u_{i,j-1} \right. \\ \left. - 4\varepsilon u_{i,j} + (\varepsilon - b_1 h/2) u_{i+1,j} + (\varepsilon - b_2 h/2) u_{i,j+1} \right] = f(x_i, y_j)$$

Resultados Numéricos

Encontrar $u(x, y)$ satisfazendo a seguinte equação:

$$\begin{aligned} -\varepsilon \Delta u(x, y) + \mathbf{b} \cdot \nabla u(x, y) &= f(x, y) \quad \text{em } \Omega \\ u(x, y) &= \bar{u} \quad \text{sobre } \partial\Omega \end{aligned}$$

onde $\bar{u}(x, y)$ e $f(x, y)$ são derivados da seguinte solução exata

$$u(x, y) = xy \frac{(1 - e^{(x-1)b_1})(1 - e^{(y-1)b_2})}{(1 - e^{-b_1})(1 - e^{-b_2})}$$

onde $\mathbf{b} = (b_1, b_2)$, $\varepsilon = 1$ e o domínio $\Omega = [0, 1] \times [0, 1]$.

Estudo de Convergência

Para este estudo foi adotado $4 \times 4, 8 \times 8, 16 \times 16, 32 \times 32, 64 \times 64$ elementos e $\mathbf{b} = (10, 10)$.

Problema Modelo - Difusão Transiente

Seja o domínio espacial $\Omega \subset \mathbb{R}^d$ com contorno $\partial\Omega$ e o domínio temporal $\Theta = [0, T]$, dada as funções $f(\mathbf{x}, t) : \Omega \times \Theta \rightarrow \mathbb{R}$, $\bar{u}(\mathbf{x}, t) : \partial\Omega \times \Theta \rightarrow \mathbb{R}$, $\varphi(\mathbf{x}) : \Omega \rightarrow \mathbb{R}$ e $\varepsilon > 0$, encontrar $u(\mathbf{x}, t) : \Omega \times \Theta \rightarrow \mathbb{R}$, tal que:

$$\frac{\partial u}{\partial t} - \varepsilon \Delta u = f(\mathbf{x}, t), \quad (\mathbf{x}, t) \in \Omega \times \Theta$$

suplementado por condições de Dirichlet

$$u(\mathbf{x}, t) = \bar{u}(\mathbf{x}, t),$$

e a condição inicial

$$u(\mathbf{x}, 0) = \varphi(\mathbf{x}).$$

onde $\mathbf{x} = (x, y)$

Discretização

Definindo $\Delta t = T/(N - 1)$ e $t_n = n\Delta t$, com $n = 0, 1, 2, \dots, N$, onde N é um inteiro positivo. Para o termo da derivada segunda no espaço adotamos um esquema de diferença central, com $\Delta x = \Delta y = h$,

$$\begin{aligned} \frac{u_{i,j}^{n+1} - u_{i,j}^n}{\Delta t} - \varepsilon \left(\frac{u_{i-1,j}^{n+1} + u_{i,j-1}^{n+1} - 4u_{i,j}^{n+1} + u_{i+1,j}^{n+1} + u_{i,j+1}^{n+1}}{h^2} \right) \\ = f(x_i, y_j, t_n + \Delta t), \end{aligned}$$

ordem de convergência $\mathcal{O}(h^2, \Delta t)$

Comentários

- ▶ Matriz gerada seguindo os mesmos **passos apresentados anteriormente** incluindo o termo temporal no passo de tempo $n + 1$.
- ▶ O termo fonte inclui a solução no passo de tempo n .
- ▶ O custo computacional aplicando a estratégia de decomposição LU para resolver o sistema é da ordem de $\frac{2}{3}k^3n$, onde k é a dimensão da matriz e n o número de passos temporais

Exemplo: Já vimos que para uma malha de 64×64 elementos, aplicando a decomposição LU, necessitamos de $\frac{2}{3}k^3 = \frac{2}{3}3969^3 = 41.682.334.806$ operações. Se for necessário $n = 1000$ iterações no tempo, esse número de operações aumenta mil vezes.

Método ADI

Uma alternativa para reduzir o custo computacional é o método implícito de direções alternadas ADI¹ (*Alternating Direction Implicit*). Esta metodologia é feita em dois passos, como segue:

- **Primeiro Passo:** (Implícito em x)

$$\frac{\hat{u}_{i,j}^{n+1/2} - u_{i,j}^n}{\Delta t/2} = \varepsilon \left[\frac{\hat{u}_{i+1,j}^{n+1/2} - 2\hat{u}_{i,j}^{n+1/2} + \hat{u}_{i-1,j}^{n+1/2}}{\Delta x^2} + \frac{u_{i,j+1}^n - 2u_{i,j}^n + u_{i,j-1}^n}{\Delta y^2} \right]$$

- **Segundo Passo:** (Implícito em y)

$$\frac{u_{i,j}^{n+1} - \hat{u}_{i,j}^{n+1/2}}{\Delta t/2} = \varepsilon \left[\frac{\hat{u}_{i+1,j}^{n+1/2} - 2\hat{u}_{i,j}^{n+1/2} + \hat{u}_{i-1,j}^{n+1/2}}{\Delta x^2} + \frac{u_{i,j+1}^{n+1} - 2u_{i,j}^{n+1} + u_{i,j-1}^{n+1}}{\Delta y^2} \right]$$

- ▶ Método incondicionalmente estável por von Neumann
- ▶ Ordem de convergência $\mathcal{O}(h^2, \Delta t^2)$
- ▶ Solução de matrizes tridiagonais em cada passo.

¹D. W. Peaceman and H. H. Rachford, Jr., The Numerical Solution of Parabolic and Elliptic Differential Equations. J Soc. Indust. Appl. Math., 3(1), 28–41. <https://doi.org/10.1137/0103003>

Método ADI

Escolhendo $\Delta x = \Delta y = h$ e $\sigma = \frac{\varepsilon \Delta t}{h^2}$, podemos reescrever a discretização da seguinte forma:

$$(1 + \sigma)\hat{u}_{i,j}^{n+1/2} - \frac{\sigma}{2} \left(\hat{u}_{i+1,j}^{n+1/2} + \hat{u}_{i-1,j}^{n+1/2} \right) = (1 - \sigma)u_{i,j}^n + \frac{\sigma}{2} (u_{i,j+1}^n + u_{i,j-1}^n)$$

$$(1 + \sigma)u_{i,j}^{n+1} - \frac{\sigma}{2} (u_{i,j+1}^{n+1} + u_{i,j-1}^{n+1}) = (1 - \sigma)\hat{u}_{i,j}^{n+1/2} + \frac{\sigma}{2} (\hat{u}_{i+1,j}^{n+1/2} + \hat{u}_{i-1,j}^{n+1/2})$$

- ▶ Primeiro passo: resolve a difusão na direção x com a condição inicial. Neste passo, a difusão em x é incógnita e a difusão em y conhecida.
- ▶ Segundo passo: resolve a difusão na direção y , que agora é incógnita, utilizando a solução do primeiro passo para difusão em x , que entra na segunda expressão de forma conhecida.

Método ADI – First step

Supondo uma malha de 4×4 elementos, primeiramente resolvemos a difusão em x implícita e em y explícita para cada plano x . Assim:

► Para $n = 0$, $i = 1$ e $j = 1$

$$(1 + \sigma)\hat{u}_{1,1}^{1/2} - \frac{\sigma}{2} \left(\hat{u}_{2,1}^{1/2} + \hat{u}_{0,1}^{1/2} \right) = (1 - \sigma)u_{1,1}^0 + \frac{\sigma}{2} (u_{1,2}^0 + u_{1,0}^0)$$

$$\begin{bmatrix} (1 + \sigma) & -\sigma/2 & 0 \\ \times & \times & \times \\ \times & \times & \times \end{bmatrix} \begin{bmatrix} \hat{u}_{1,1}^{1/2} \\ \hat{u}_{2,1}^{1/2} \\ \hat{u}_{3,1}^{1/2} \end{bmatrix} = \begin{bmatrix} (1 - \sigma)u_{1,1}^0 + \frac{\sigma}{2}(u_{1,2}^0 + u_{1,0}^0 + \hat{u}_{0,1}^{1/2}) \\ \times \\ \times \end{bmatrix}$$

Método ADI – First step

► Para $n = 0$, $i = 2$ e $j = 1$

$$(1 + \sigma)\hat{u}_{2,1}^{1/2} - \frac{\sigma}{2} \left(\hat{u}_{3,1}^{1/2} + \hat{u}_{1,1}^{1/2} \right) = (1 - \sigma)u_{2,1}^0 + \frac{\sigma}{2} (u_{2,2}^0 + u_{2,0}^0)$$

$$\begin{bmatrix} (1 + \sigma) & -\sigma/2 & 0 \\ -\sigma/2 & (1 + \sigma) & -\sigma/2 \\ \times & \times & \times \end{bmatrix} \begin{bmatrix} \hat{u}_{1,1}^{1/2} \\ \hat{u}_{2,1}^{1/2} \\ \hat{u}_{3,1}^{1/2} \end{bmatrix} = \begin{bmatrix} (1 - \sigma)u_{1,1}^0 + \frac{\sigma}{2}(u_{1,2}^0 + u_{1,0}^0 + \hat{u}_{0,1}^{1/2}) \\ (1 - \sigma)u_{2,1}^0 + \frac{\sigma}{2}(u_{2,2}^0 + u_{2,0}^0) \\ \times \end{bmatrix}$$

Método ADI – First step

► Para $n = 0$, $i = 3$ e $j = 1$

$$(1 + \sigma)\hat{u}_{3,1}^{1/2} - \frac{\sigma}{2} \left(\hat{u}_{4,1}^{1/2} + \hat{u}_{2,1}^{1/2} \right) = (1 - \sigma)u_{3,1}^0 + \frac{\sigma}{2} (u_{3,2}^0 + u_{3,0}^0)$$

$$\begin{bmatrix} (1 + \sigma) & -\sigma/2 & 0 \\ -\sigma/2 & (1 + \sigma) & -\sigma/2 \\ 0 & -\sigma/2 & (1 + \sigma) \end{bmatrix} \begin{bmatrix} \hat{u}_{1,1}^{1/2} \\ \hat{u}_{2,1}^{1/2} \\ \hat{u}_{3,1}^{1/2} \end{bmatrix} = \begin{bmatrix} (1 - \sigma)u_{1,1}^0 + \frac{\sigma}{2}(u_{1,2}^0 + u_{1,0}^0 + \hat{u}_{0,1}^{1/2}) \\ (1 - \sigma)u_{2,1}^0 + \frac{\sigma}{2}(u_{2,2}^0 + u_{2,0}^0) \\ (1 - \sigma)u_{3,1}^0 + \frac{\sigma}{2}(u_{3,2}^0 + u_{3,0}^0 + \hat{u}_{4,1}^{1/2}) \end{bmatrix}$$

Método ADI – First step

- Para $n = 0, i = 1$ e $j = 2$

$$(1 + \sigma)\hat{u}_{1,2}^{1/2} - \frac{\sigma}{2} \left(\hat{u}_{2,2}^{1/2} + \hat{u}_{0,2}^{1/2} \right) = (1 - \sigma)u_{1,2}^0 + \frac{\sigma}{2} (u_{1,3}^0 + u_{1,1}^0)$$

- Para $n = 0, i = 2$ e $j = 2$

$$(1 + \sigma)\hat{u}_{2,2}^{1/2} - \frac{\sigma}{2} \left(\hat{u}_{3,2}^{1/2} + \hat{u}_{1,2}^{1/2} \right) = (1 - \sigma)u_{2,2}^0 + \frac{\sigma}{2} (u_{2,3}^0 + u_{2,1}^0)$$

- Para $n = 0, i = 3$ e $j = 2$

$$(1 + \sigma)\hat{u}_{3,2}^{1/2} - \frac{\sigma}{2} \left(\hat{u}_{4,2}^{1/2} + \hat{u}_{2,2}^{1/2} \right) = (1 - \sigma)u_{3,2}^0 + \frac{\sigma}{2} (u_{3,3}^0 + u_{3,1}^0)$$

$$\begin{bmatrix} (1 + \sigma) & -\sigma/2 & 0 \\ -\sigma/2 & (1 + \sigma) & -\sigma/2 \\ 0 & -\sigma/2 & (1 + \sigma) \end{bmatrix} \begin{bmatrix} \hat{u}_{1,2}^{1/2} \\ \hat{u}_{2,2}^{1/2} \\ \hat{u}_{3,2}^{1/2} \end{bmatrix} = \begin{bmatrix} (1 - \sigma)u_{1,2}^0 + \frac{\sigma}{2}(u_{1,3}^0 + u_{1,1}^0 + \hat{u}_{0,2}^{1/2}) \\ (1 - \sigma)u_{2,2}^0 + \frac{\sigma}{2}(u_{2,3}^0 + u_{2,1}^0) \\ (1 - \sigma)u_{3,2}^0 + \frac{\sigma}{2}(u_{3,3}^0 + u_{3,1}^0 + \hat{u}_{4,2}^{1/2}) \end{bmatrix}$$

Método ADI – First step

- Para $n = 0, i = 1$ e $j = 3$

$$(1 + \sigma)\hat{u}_{1,3}^{1/2} - \frac{\sigma}{2} \left(\hat{u}_{2,3}^{1/2} + \hat{u}_{0,3}^{1/2} \right) = (1 - \sigma)u_{1,3}^0 + \frac{\sigma}{2} (u_{1,4}^0 + u_{1,2}^0)$$

- Para $n = 0, i = 2$ e $j = 3$

$$(1 + \sigma)\hat{u}_{2,3}^{1/2} - \frac{\sigma}{2} \left(\hat{u}_{3,3}^{1/2} + \hat{u}_{1,3}^{1/2} \right) = (1 - \sigma)u_{2,3}^0 + \frac{\sigma}{2} (u_{2,4}^0 + u_{2,2}^0)$$

- Para $n = 0, i = 3$ e $j = 3$

$$(1 + \sigma)\hat{u}_{3,3}^{1/2} - \frac{\sigma}{2} \left(\hat{u}_{4,3}^{1/2} + \hat{u}_{2,3}^{1/2} \right) = (1 - \sigma)u_{3,3}^0 + \frac{\sigma}{2} (u_{3,4}^0 + u_{3,2}^0)$$

$$\begin{bmatrix} (1 + \sigma) & -\sigma/2 & 0 \\ -\sigma/2 & (1 + \sigma) & -\sigma/2 \\ 0 & -\sigma/2 & (1 + \sigma) \end{bmatrix} \begin{bmatrix} \hat{u}_{1,3}^{1/2} \\ \hat{u}_{2,3}^{1/2} \\ \hat{u}_{3,3}^{1/2} \end{bmatrix} = \begin{bmatrix} (1 - \sigma)u_{1,3}^0 + \frac{\sigma}{2}(u_{1,4}^0 + u_{1,2}^0 + \hat{u}_{0,3}^{1/2}) \\ (1 - \sigma)u_{2,3}^0 + \frac{\sigma}{2}(u_{2,4}^0 + u_{2,2}^0) \\ (1 - \sigma)u_{3,3}^0 + \frac{\sigma}{2}(u_{3,4}^0 + u_{3,2}^0 + \hat{u}_{4,3}^{1/2}) \end{bmatrix}$$

Método ADI – Second step

Na segunda etapa, a solução $\hat{u}_{i,j}^{n+1/2}$ do termo difusivo em x é usada para obter a solução da variável de interesse $u_{i,j}^{n+1}$ referente a componente difusiva y que é calculada implicitamente.

- ▶ Para $n = 0, i = 1$ e $j = 1$

$$(1 + \sigma)u_{1,1}^1 - \frac{\sigma}{2} (u_{1,2}^1 + u_{1,0}^1) = (1 - \sigma)\hat{u}_{1,1}^{1/2} + \frac{\sigma}{2} (\hat{u}_{2,1}^{1/2} + \hat{u}_{0,1}^{1/2})$$

- ▶ Para $n = 0, i = 1$ e $j = 2$

► Para $n = 0$, $i = 3$ e $j = 3$

$$(1 + \sigma)u_{3,3}^1 - \frac{\sigma}{2} (u_{3,4}^1 + u_{3,2}^1) = (1 - \sigma)\hat{u}_{3,3}^{1/2} + \frac{\sigma}{2} (\hat{u}_{4,3}^{1/2} + \hat{u}_{2,3}^{1/2})$$

$$\begin{bmatrix} (1 + \sigma) & -\sigma/2 & 0 \\ -\sigma/2 & (1 + \sigma) & -\sigma/2 \\ 0 & -\sigma/2 & (1 + \sigma) \end{bmatrix} \begin{bmatrix} u_{3,1}^1 \\ u_{3,2}^1 \\ u_{3,3}^1 \end{bmatrix} = \begin{bmatrix} (1 - \sigma)\hat{u}_{3,1}^{1/2} + \frac{\sigma}{2}(\hat{u}_{4,1}^{1/2} + \hat{u}_{2,1}^{1/2} + u_{3,0}^1) \\ (1 - \sigma)\hat{u}_{3,2}^{1/2} + \frac{\sigma}{2}(\hat{u}_{4,2}^{1/2} + \hat{u}_{2,2}^{1/2}) \\ (1 - \sigma)\hat{u}_{3,3}^{1/2} + \frac{\sigma}{2}(\hat{u}_{4,3}^{1/2} + \hat{u}_{2,3}^{1/2} + u_{3,4}^1) \end{bmatrix}$$

Testes Numéricos

$$\frac{\partial u}{\partial t} - \varepsilon \Delta u = 0 \quad \text{em} \quad \Omega \times \Theta$$

suplementado por condições de Dirichlet

$$u(x, y, t) = 0, \quad \text{sobre} \quad \partial\Omega \times \Theta$$

e a condição inicial

$$u(x, y, 0) = \varphi(x, y) = \sin(\pi x/2) \sin(\pi y/2).$$

Uma solução exata para este problema é dada por:

$$u(x, y, t) = e^{-\pi^2 t/2} \sin(\pi x/2) \sin(\pi y/2)$$

no domínio espacial $\Omega = [0, 2] \times [0, 2]$ e temporal $\Theta = [0, 0.5]$ com $\varepsilon = 1.0$.

Estudo de Convergência

Para este estudo foi adotado $4 \times 4, 8 \times 8, 16 \times 16, 32 \times 32, 64 \times 64$ elementos e $\Delta t = h$.

Problema Modelo – Difusão-Convecção Transiente

Seja o domínio espacial $\Omega \subset \mathbb{R}^d$ com contorno $\partial\Omega$ e o domínio temporal $\Theta = [0, T]$, dada as funções $f(\mathbf{x}, t) : \Omega \times \Theta \rightarrow \mathbb{R}$, $\bar{u}(\mathbf{x}, t) : \partial\Omega \times \Theta \rightarrow \mathbb{R}$, $\varphi(\mathbf{x}) : \Omega \rightarrow \mathbb{R}$, $\varepsilon > 0$ e $\mathbf{b} = (b_1, b_2)$, encontrar $u(\mathbf{x}, t) : \Omega \times \Theta \rightarrow \mathbb{R}$, tal que:

$$\frac{\partial u}{\partial t} - \varepsilon \Delta u + \mathbf{b} \cdot \nabla u = f(\mathbf{x}, t), \quad (\mathbf{x}, t) \in \Omega \times \Theta$$

suplementado por condições de Dirichlet

$$u(\mathbf{x}, t) = \bar{u}(\mathbf{x}, t),$$

e a condição inicial

$$u(\mathbf{x}, 0) = \varphi(\mathbf{x}),$$

onde $\mathbf{x} = (x, y)$.

Método ADI – Esquema Upwind

Combinando a estratégia ADI com uma discretização upwind para o termo convectivo, obtemos:

$$\begin{aligned} \frac{\hat{u}_{i,j}^{n+1/2} - u_{i,j}^n}{\Delta t/2} &= \varepsilon \left[\frac{\hat{u}_{i+1,j}^{n+1/2} - 2\hat{u}_{i,j}^{n+1/2} + \hat{u}_{i-1,j}^{n+1/2}}{\Delta x^2} + \frac{u_{i,j+1}^n - 2u_{i,j}^n + u_{i,j-1}^n}{\Delta y^2} \right] \\ &- \begin{cases} b_1 \frac{\hat{u}_{i,j}^{n+1/2} - \hat{u}_{i-1,j}^{n+1/2}}{\Delta x} + b_2 \frac{u_{i,j}^n - u_{i,j-1}^n}{\Delta y} & b_1, b_2 > 0 \\ b_1 \frac{\hat{u}_{i+1,j}^{n+1/2} - \hat{u}_{i,j}^{n+1/2}}{\Delta x} + b_2 \frac{u_{i,j+1}^n - u_{i,j}^n}{\Delta y} & b_1, b_2 < 0 \end{cases} \\ \frac{u_{i,j}^{n+1} - \hat{u}_{i,j}^{n+1/2}}{\Delta t/2} &= \varepsilon \left[\frac{\hat{u}_{i+1,j}^{n+1/2} - 2\hat{u}_{i,j}^{n+1/2} + \hat{u}_{i-1,j}^{n+1/2}}{\Delta x^2} + \frac{u_{i,j+1}^{n+1} - 2u_{i,j}^{n+1} + u_{i,j-1}^{n+1}}{\Delta y^2} \right] \\ &- \begin{cases} b_1 \frac{\hat{u}_{i,j}^{n+1/2} - \hat{u}_{i-1,j}^{n+1/2}}{\Delta x} + b_2 \frac{u_{i,j}^{n+1} - u_{i,j-1}^{n+1}}{\Delta y} & b_1, b_2 > 0 \\ b_1 \frac{\hat{u}_{i+1,j}^{n+1/2} - \hat{u}_{i,j}^{n+1/2}}{\Delta x} + b_2 \frac{u_{i,j+1}^{n+1} - u_{i,j}^{n+1}}{\Delta y} & b_1, b_2 < 0 \end{cases} \end{aligned}$$

Método ADI – Esquema Upwind

Escolhendo $\Delta x = \Delta y = h$ e supondo $b_1, b_2 > 0$, podemos reescrever a discretização da seguinte forma:

$$\begin{aligned} \left(1 + \sigma + \frac{\rho_1}{2}\right) \hat{u}_{i,j}^{n+1/2} - \frac{\sigma}{2} \hat{u}_{i+1,j}^{n+1/2} - \left(\frac{\rho_1 + \sigma}{2}\right) \hat{u}_{i-1,j}^{n+1/2} &= \left(1 - \sigma - \frac{\rho_2}{2}\right) u_{i,j}^n \\ &+ \frac{\sigma}{2} u_{i,j+1}^n + \left(\frac{\sigma + \rho_2}{2}\right) u_{i,j-1}^n \end{aligned}$$

$$\begin{aligned} \left(1 + \sigma + \frac{\rho_2}{2}\right) u_{i,j}^{n+1} - \frac{\sigma}{2} u_{i,j+1}^{n+1} - \left(\frac{\rho_2 + \sigma}{2}\right) u_{i,j-1}^{n+1} &= \left(1 - \sigma - \frac{\rho_1}{2}\right) \hat{u}_{i,j}^{n+1/2} \\ &+ \frac{\sigma}{2} \hat{u}_{i+1,j}^{n+1/2} + \left(\frac{\sigma + \rho_1}{2}\right) \hat{u}_{i-1,j}^{n+1/2} \end{aligned}$$

onde

$$\sigma = \frac{\varepsilon \Delta t}{h^2}; \quad \rho_1 = \frac{b_1 \Delta t}{h}; \quad \rho_2 = \frac{b_2 \Delta t}{h}.$$

Método ADI – Esquema Central

Combinando a estratégia ADI com uma discretização upwind para o termo convectivo, obtemos:

$$\frac{\hat{u}_{i,j}^{n+1/2} - u_{i,j}^n}{\Delta t/2} = \varepsilon \left[\frac{\hat{u}_{i+1,j}^{n+1/2} - 2\hat{u}_{i,j}^{n+1/2} + \hat{u}_{i-1,j}^{n+1/2}}{\Delta x^2} + \frac{u_{i,j+1}^n - 2u_{i,j}^n + u_{i,j-1}^n}{\Delta y^2} \right] - \left[b_1 \frac{\hat{u}_{i+1,j}^{n+1/2} - \hat{u}_{i-1,j}^{n+1/2}}{2\Delta x} + b_2 \frac{u_{i,j+1}^n - u_{i,j-1}^n}{2\Delta y} \right]$$

$$\frac{u_{i,j}^{n+1} - \hat{u}_{i,j}^{n+1/2}}{\Delta t/2} = \varepsilon \left[\frac{\hat{u}_{i+1,j}^{n+1/2} - 2\hat{u}_{i,j}^{n+1/2} + \hat{u}_{i-1,j}^{n+1/2}}{\Delta x^2} + \frac{u_{i,j+1}^{n+1} - 2u_{i,j}^{n+1} + u_{i,j-1}^{n+1}}{\Delta y^2} \right] - \left[b_1 \frac{\hat{u}_{i+1,j}^{n+1/2} - \hat{u}_{i-1,j}^{n+1/2}}{2\Delta x} + b_2 \frac{u_{i,j+1}^{n+1} - u_{i,j-1}^{n+1}}{2\Delta y} \right]$$

Método ADI – Esquema Central

Escolhendo $\Delta x = \Delta y = h$, podemos reescrever a discretização da seguinte forma:

$$(1 + \sigma) \hat{u}_{i,j}^{n+1/2} + \left(\frac{\rho_1}{4} - \frac{\sigma}{2} \right) \hat{u}_{i+1,j}^{n+1/2} - \left(\frac{\rho_1}{4} + \frac{\sigma}{2} \right) \hat{u}_{i-1,j}^{n+1/2} = (1 - \sigma) u_{i,j}^n \\ + \left(\frac{\sigma}{2} - \frac{\rho_2}{4} \right) u_{i,j+1}^n + \left(\frac{\sigma}{2} + \frac{\rho_2}{4} \right) u_{i,j-1}^n$$

$$(1 + \sigma) u_{i,j}^{n+1} + \left(\frac{\rho_2}{4} - \frac{\sigma}{2} \right) u_{i,j+1}^{n+1} - \left(\frac{\rho_2}{4} + \frac{\sigma}{2} \right) u_{i,j-1}^{n+1} = (1 - \sigma) \hat{u}_{i,j}^{n+1/2} \\ + \left(\frac{\sigma}{2} - \frac{\rho_1}{4} \right) \hat{u}_{i+1,j}^{n+1/2} + \left(\frac{\sigma}{2} + \frac{\rho_1}{4} \right) \hat{u}_{i-1,j}^{n+1/2}$$

Resultados Numéricos

Encontrar $u(x, y, t) \in \Omega \times \Theta$ satisfazendo a seguinte equação:

$$\frac{\partial u}{\partial t} - \varepsilon \Delta u + \mathbf{b} \cdot \nabla u = f(x, y, t) \quad \text{em } \Omega \times \Theta$$

$$u(x, y, t) = \bar{u} \quad \text{sobre } \partial\Omega \times \Theta$$

$$u(x, y, 0) = \varphi(x, y) \quad \text{em } \Omega$$

Uma solução exata para este problema é dada por

$$u(x, y, t) = e^{-2\pi^2 t} \sin(\pi x) \sin(\pi y)$$

para esta solução no domínio $\Omega = [0, 1] \times [0, 1]$, temos $\bar{u} = 0$,

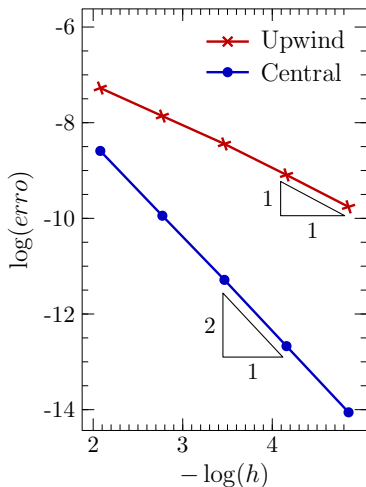

$$\varphi(x, y) = \sin(\pi x) \sin(\pi y)$$

e

$$f(x, y, t) = \pi e^{-2\pi^2 t} (b_1 \cos(\pi x) \sin(\pi y) + b_2 \sin(\pi x) \cos(\pi y))$$

Estudo de Convergência

Para este estudo foi adotado $8 \times 8, 16 \times 16, 32 \times 32, 64 \times 64, 128 \times 128$ elementos, $\varepsilon = 1$, $\mathbf{b} = (1, 1)$ e $\Delta t = h$.

Custo Computacional

Supondo os dados:

- ▶ malha de 64×64 elementos
- ▶ $n = 1000$ iterações no tempo
- ▶ k número de equações do sistema

As metodologias requerem a seguinte quantidade de operações (para a resolução das matrizes)

- ▶ Decomposição LU (complexidade – $2k^3/3$)
 - ▶ $\frac{2}{3}k^3 = \frac{2}{3}3969^3 = 41.682.334.806$ (a cada passo de tempo)
 - ▶ $\frac{2}{3}k^3n = \frac{2}{3}3969^31000 = 41.682.334.806.000$ (total)
- ▶ Algoritmo de Thomas (complexidade – $8k$)
 - ▶ 64 equações calculadas 64 vezes em cada direção (x e y)
 - ▶ $8 \times 64 \times 64 \times 64 = 2.097.152$ (a cada passo de tempo)
 - ▶ $8 \times 64 \times 64 \times 64 \times 1000 = 2.097.152.000$ (total)
